EDUCATION

University of California, Los Angeles (UCLA) – B.S. Computer Science, Expected June 2029 | GPA: 3.85/4.00
Amador Valley High School – Pleasanton, CA (2021–2025)

EXPERIENCES

UCLA ACM AI – AISF Neurosymbolic Research | Co-Researcher

2026

- Collaborating with a team of 4, guided by a senior researcher, on a paper targeting LLM hallucination reduction via neurosymbolic constrained context updates — preparing for submission to ICML workshop.
- Designing a system that stores LLM context in a Scallop-constrained dynamic knowledge graph, preventing logically inconsistent updates; implementing a recursive LLM architecture that segments long contexts into structured subchunks to improve coherence.
- Evaluating against baselines (GEPA, Dynamic Cheatsheet) on LongBench to quantify reduction in hallucination rates through constrained symbolic state management.

AVBotz Robotics Club | Software Developer

2021 – 2025

- Contributed to international RoboSub Competition placements of **2nd** (2022), **5th** (2023), and **14th** (2024); built a Gazebo simulation environment to accelerate subsystem iteration and authored integration test suites validating each subsystem.
- Benchmarked YOLOv5 vs. YOLOR on precision, recall, and confidence metrics; migrated the vision pipeline to YOLOv8, improving detection of small overlapping objects across RoboSub tasks (Torpedos, Ball Dropper, Octagon).

Cybersecurity Club | Competitive Member

2023 – 2025

- Placed **28th** nationally (top 2%) in PicoCTF 2025 among 1,817 U.S. high school teams (5,610 pts) as part of a 5-member team.
- Applied buffer overflow, SQL injection, XSS, format string exploitation, steganography, and cryptographic techniques (Base64, hex, ChaCha20-Poly1305); proficient in Ghidra, BurpSuite, and Wireshark.

PROJECTS

SortaAI – GenAI Hackathon | AWS × BruinAI Summit | “Most Innovative Product”

2025

- Built an AI email assistant using AWS Bedrock + Gmail OAuth to summarize, classify, and prioritize messages; full-stack prototype with Streamlit frontend and Flask backend (team of 4).
github.com/lektphire/AWS_Summit_2025
- Integrated generative AI with OAuth-secured Gmail access to deliver actionable inbox prioritization, reducing manual email triage.

Fuzz Testing – duckx Library | Honggfuzz

2025

- Partnered with one other student to fuzz-test duckx, a C++ .docx parsing library, using Honggfuzz with malformed inputs targeting file parsing routines.
- Achieved broad code coverage across parsing edge cases; no crashes or vulnerabilities found, validating library robustness and demonstrating applied security testing methodology.

Reminiscence – Story Puzzle Platformer | Unity (C#)

2026

- Serving as programmer on an ongoing team-developed platformer inspired by Little Nightmares, centered on swapping between past and present states to solve environmental puzzles.
- Implemented dual-state scene logic managing object persistence across timelines and smooth time-swap transitions to support narrative-driven level design.

TECHNICAL SKILLS: Languages: C++, Python, C, Javascript, HTML, MySQL **Open Source Frameworks:** Git, Linux/Unix, React.js **Tools:** Ghidra, BurpSuite, Wireshark, Unity
